

## Beam Design - Beam A-B

### 1. Beam Data

Load Type: Uniform Dist. Load  
Support: Simple Beam  
Beam Type: Sawn Lumber  
Species: Douglas Fir-Larch  
Grade: DF No.2  
Size: 4 x 10  
Design Span (L): 9.75 ft.  
Clear Span: 9.50 ft.  
Total Span: 10.00 ft.  
Bearing (lb): 3 in.  
Quantity (N): 1

### 2. Design Loads

Live Load: 35 plf  
Dead Load: 10 plf  
Selfweight: 75.0 lbs  
Dist. Selfweight: 7.69 plf  
Total Weight: 76.9 lbs

### 3. Design Options

Lateral Support: braced  
Defl. Limits: 180/120  
Load Duration: 1.15  
Exposure: dry  
Temperature:  $T \leq 100^{\circ}\text{F}$   
Orientation: Vertical  
Incised Lumber: No  
Rep. Members: No

### 4. Design Assumptions and Notes

Code Standard: IBC 2015, NDS 2015  
Bending Stress: Parallel to Grain  
Notes:

### 5. Adjustment Factors

Factor	Description	$F_b$	$F_t$	$F_v$	$F_c$	$F_{c\perp}$	$E/E_{min}$
$C_D$	Load Duration Factor	1.15	1.15	1.15	1.15	-	-
$C_M$	Wet Service Factor	$1^b$	1	1	$1^c$	1	1
$C_t$	Temperature Factor	1	1	1	1	1	1
$C_L$	Beam Stability Factor	1	-	-	-	-	-
$C_F$	Size Factor	1.2	1.1	-	1	-	-
$C_{fu}$	Flat Use Factor	$1.1^d$	-	-	-	-	-
$C_i$	Incising Factor	1	1	1	1	1	1
$C_r$	Repetitive Member Factor	1	-	-	-	-	-

a) Adjustment factors per AWC NDS 2015 and NDS 2015 Supplement.

b) When  $(F_b)(C_F) \leq 1,150$  psi,  $C_M = 1.0$ .

c) When  $(F_c)(C_F) \leq 750$  psi,  $C_M = 1.0$ .

d) Only applies when sawn lumber or glulam beams are loaded in bending about the y-y axis.

## 6. Beam Calculations

Determine reference design values, sectional properties and self weight of beam:

$$A = b \times d$$

$$S_x = \frac{bd^2}{6}, S_y = \frac{b^2d}{6}$$

$$I_x = \frac{bd^3}{12}, I_y = \frac{b^3d}{12}$$

where:

b = Breadth of rectangular beam in bending (in.)

d = Depth of rectangular beam in bending (in.)

A = Cross sectional area of beam (in.<sup>2</sup>)

S<sub>x</sub> = Section modulus about the X-X axis (in.<sup>3</sup>)

S<sub>y</sub> = Section modulus about the Y-Y axis (in.<sup>3</sup>)

I<sub>x</sub> = Moment of inertia about the X-X axis (in.<sup>4</sup>)

I<sub>y</sub> = Moment of inertia about the Y-Y axis (in.<sup>4</sup>)

$$b = 3.500 \text{ in.}$$

$$d = 9.250 \text{ in.}$$

$$A = 3.500 \times 9.250 = 32.38 \text{ in.}^2$$

$$S_x = (3.500)(9.250)^2/6 = 49.91 \text{ in.}^3$$

$$S_y = (3.500)^2(9.250)/6 = 18.89 \text{ in.}^3$$

$$I_x = (3.500)(9.250)^3/12 = 230.84 \text{ in.}^4$$

$$I_y = (3.500)^3(9.250)/12 = 33.05 \text{ in.}^4$$

Reference Design Values from Table 4A NDS Supplement (Reference Design Values for Visually Graded Dimension Lumber, 2" - 4" thick).

Species & Grade	F <sub>b</sub>	F <sub>t</sub>	F <sub>v</sub>	F <sub>c</sub> ⊥	F <sub>c</sub>	E	E <sub>min</sub>	G
DF No.2	900	575	180	625	1350	1600000	580000	0.5

The following formula shall be used to determine the density of wood (lbs/ft<sup>3</sup>). (NDS Supplement Sec. 3.1.3)

$$\rho_w = 62.4 \left[ \frac{G}{1 + G(0.009)(m.c.)} \right] \left[ 1 + \frac{m.c.}{100} \right]$$

where:

ρ<sub>w</sub> = Density of wood (lbs/ft<sup>3</sup>)

G = Specific gravity of wood (dimensionless)

m.c. = Moisture content of wood (percentile)

$$G = 0.5$$

$$m.c. = 19 \% \text{ (Max. moisture content at dry service conditions)}$$

Date 1/6/2026	 This report may not be copied, reproduced or distributed without the written consent of Engineering Company Inc. Copyright © 2026		Page 2

$$\rho_w = 62.4 \left[ \frac{0.5}{1 + 0.5(0.009)(19)} \right] \left[ 1 + \frac{19}{100} \right] = 34.20 \text{ lbs/ft}^3$$

$$\text{Volume}_{\text{total}} = N[A \times (L + l_b)] = 1 \times [32.38 \times (117.00 + 3)] \times (12 \text{ in./ft.})^3 = 2.25 \text{ ft}^3$$

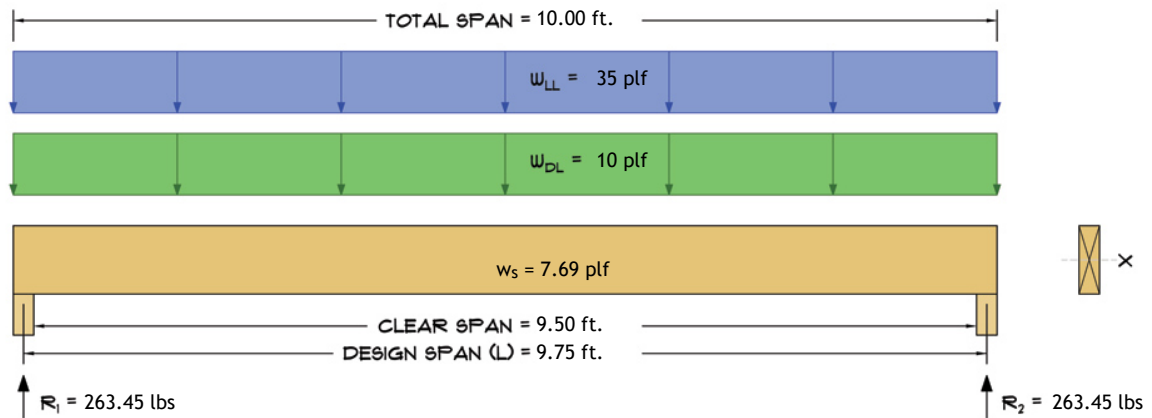

$$\text{Volume}_{\text{span}} = N[A \times L] = 1 \times [32.38 \times 117.00] \times (12 \text{ in./ft.})^3 = 2.19 \text{ ft}^3$$

$$\text{Total Weight (W}_T\text{)} = \rho_w \times \text{Volume}_{\text{total}} = 34.20 \times 2.25 = 76.9 \text{ lbs}$$

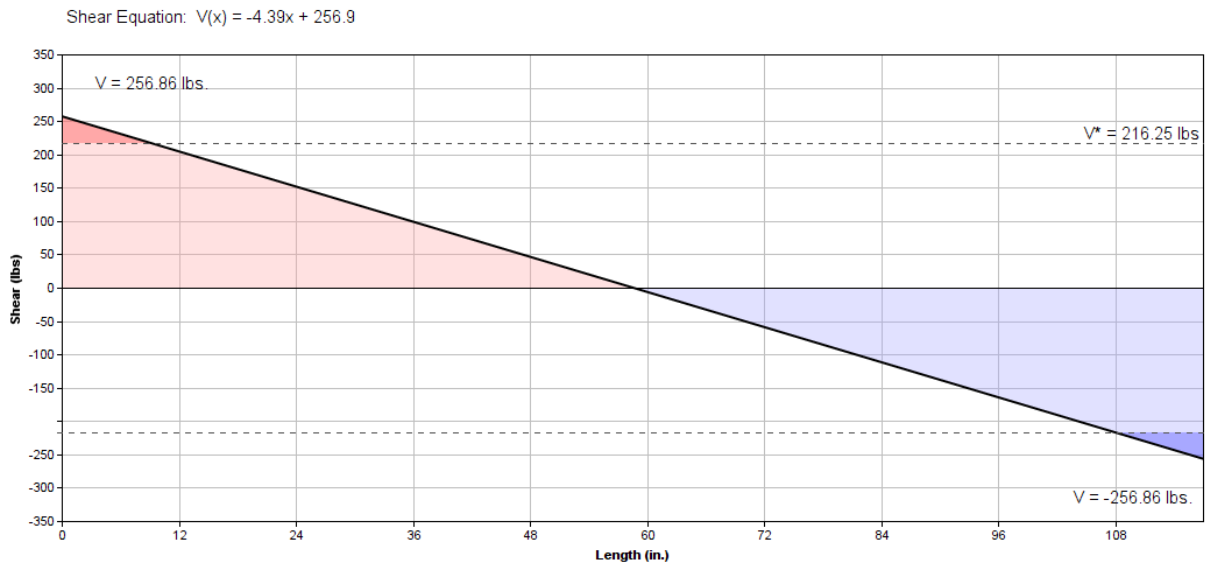

$$\text{Self Weight (W}_S\text{)} = \rho_w \times \text{Volume}_{\text{span}} = 34.20 \times 2.19 = 75.0 \text{ lbs}$$

$$\text{Distributed Self Weight (w}_s\text{)} = \frac{W_S}{L} = \frac{75.0}{9.75} = 7.69 \text{ plf}$$

Load, Shear and Moment Diagrams:

Beam - Shear Diagram

### Beam - Moment Diagram

#### 1.) Bending:

Members subject to bending stresses shall be proportioned so that the actual bending stress or moment shall not exceed the adjusted bending design value:

$$f_b \leq F_b' \quad (NDS \text{ Sec. } 3.3.1)$$

where:

$$f_b = M / S$$

$$F_b' = F_b(C_D)(C_M)(C_t)(C_L)(C_F)(C_i)(C_r)$$

Beam is braced laterally along its compression edge. Lateral stability is not a consideration:

$$C_L = \text{Beam Stability Factor} = 1.0$$

$$F_{bx}' = (900)(1.15)(1)(1)(1)(1.2)(1)(1) = 1242.0 \text{ psi}$$

$$f_b = \frac{M}{N \times S_x} = \frac{7513}{1 \times 49.91} = 150.5 \text{ psi}$$

$$f_b = 150.5 \text{ psi} < F_{bx}' = 1242.0 \text{ psi} \quad (\text{CSI} = 0.12) \quad ? \quad \mathbf{OK}$$

Subject Beam Design	Customer Michael Lewallen	Location 319NE Cedar St	Job No. 2514
Engr. Engineer Name	ENGINEERING COMPANY INC. Street Address City, CA 99999 ph. (800) 000-0000 www.website.com		Rev. -
Date 1/6/2026	 <p>This report may not be copied, reproduced or distributed without the written consent of Engineering Company Inc.</p>		Page 4

## 2.) Shear:

Members subject to shear stresses shall be proportioned so that the actual shear stress parallel to grain or shear force at any cross section of the bending member shall not exceed the adjusted shear design value:

$$f_v \leq F_v' \text{ (NDS Sec. 3.4.1)}$$

where:

$$f_v = \frac{3V}{2A}$$

$$F_v' = F_v(C_D)(C_M)(C_t)(C_i)$$

$$F_{vx}' = (180)(1.15)(1)(1)(1) = 207.00 \text{ psi}$$

Shear Reduction: For beams supported by full bearing on one surface and loads applied to the opposite surface, uniformly distributed loads within a distance, d, from supports equal to the depth of the bending member shall be permitted to be ignored. For beams supported by full bearing on one surface and loads applied to the opposite surface, concentrated loads within a distance equal to the depth of the bending member from supports shall be permitted to be multiplied by x/d where x is the distance from the beam support face to the load. See NDS 2015, Figure 3C.

$$f_v^* = \frac{3V^*}{2(N \times A)} = \frac{3(216.25)}{2(1 \times 32.38)} = 10.02 \text{ psi}$$

$$f_v^* = 10.02 \text{ psi} < F_{vx}' = 207.00 \text{ psi} \text{ (CSI} = 0.05) \text{ ? OK}$$

No Reduction in Shear (conservative):

$$f_v = \frac{3V}{2(N \times A)} = \frac{3(256.86)}{2(1 \times 32.38)} = 11.90 \text{ psi}$$

$$f_v = 11.90 \text{ psi} < F_{vx}' = 207.00 \text{ psi} \text{ (CSI} = 0.06) \text{ ? OK}$$

## 3.) Deflection:

Bending deflections calculated per standard method of engineering mechanics for live load and total load:

LL Allowable: L/180

TL Allowable: L/120

$$E_x' = E_x(C_M)(C_t)(C_i) = 1600000(1)(1)(1) = 1600000 \text{ psi}$$

Subject Beam Design	Customer Michael Lewallen	Location 319NE Cedar St	Job No. 2514
Engr. Engineer Name	<b>ENGINEERING COMPANY INC.</b> Street Address City, CA 99999 ph. (800) 000-0000 www.website.com		Rev. -
Date 1/6/2026	 This report may not be copied, reproduced or distributed without the written consent of Engineering Company Inc. Copyright © 2026		Page 5

$$\Delta_{LL} = \frac{5w_{LL}L^4}{384E'_x(N \times I_x)} = \frac{5(35)(9.750)^4}{384(1600000)(1 \times 230.84)} \times \left(12 \frac{in.}{ft.}\right)^3 = 0.02 \text{ in.}$$

$$(L/d)_{LL} = 117.00 / 0.02 = 6072$$

$$\Delta_{LL} = 0.02 \text{ in} = L/6072 < L/180 \quad ? \quad \mathbf{OK}$$

$$\Delta_{TL} = \frac{5(w_{TL} + w_s)L^4}{384E'_x(N \times I_x)} = \frac{5(45 + 7.69)(9.750)^4}{384(1600000)(1 \times 230.84)} \times \left(12 \frac{in.}{ft.}\right)^3 = 0.03 \text{ in.}$$

$$(L/d)_{TL} = 117.00 / 0.03 = 4034$$

$$\Delta_{TL} = 0.03 \text{ in} = L/4034 < L/120 \quad ? \quad \mathbf{OK}$$

#### 4.) Bearing:

Members subject to bearing stresses perpendicular to the grain shall be proportioned so that the actual compressive stress perpendicular to grain shall be based on the net bearing area and shall not exceed the adjusted compression design value perpendicular to grain:

$$f_{c \perp} \leq F_{c \perp}' \quad (NDS \text{ Sec. } 3.10.2)$$

where:

$$f_{c \perp} = \frac{R}{A_b}$$

$$F_{c \perp}' = F_{c \perp} (C_M)(C_t)(C_i)$$

$$F_{c \perp x}' = (625)(1)(1)(1) = 625.00 \text{ psi}$$

$$A_b = b \times l_b = 3.5 \times 3 = 10.50 \text{ in}^2$$

$$f_{c \perp} = \frac{R}{N \times A_b} = \frac{263.45}{1 \times 10.50} = 25.1 \text{ psi}$$

$$f_{c \perp} = 25.1 \text{ psi} < F_{c \perp x}' = 625.00 \text{ psi} \quad (CSI = 0.04) \quad ? \quad \mathbf{OK}$$
